Work Experience

VM & Security Engineering Intern @ Grab

July 2025 — December 2025 On Site

- Architected and deployed a Breach and Attack Simulation (BAS) platform to facilitate collaborative Purple Team exercises, utilizing Terraform and Kubernetes (EKS) to build a scalable, automated environment for threat validation.
- Engineered an automated ETL pipeline using Python and GitLab CI to ingest security telemetry into an AWS S3 data lake, centralizing critical data for enterprise-wide visibility.
- Developed a centralized Vulnerability Management (VM) Governance dashboard, utilizing complex SQL to aggregate risk metrics and provide stakeholders with actionable insights into the organization’s security posture.
- Led the end-to-end evaluation and implementation of new security infrastructure, bridging the gap between Red and Blue teams by automating attack scenarios and defensive control testing.

Education

Bachelor in Computer Science (Hons. Cybersecurity)

Multimedia University, Cyberjaya

Aug 2023 — July 2026 Cyberjaya, MY | CGPA: 3.76

Leadership Experience

Co-President

Hackerspace MMU May 2025 — Present

Achieved approx. 195 registrations, provision semesterly hackathon, setup venue every tuesday for Hackerspace session, work on side-projects.

President

MMU Esports Club April 2023 — July 2025

MoU signing between MMU and UniPin, secured partnership with UniPin and CRIT Esports, restructured organisation, organised university-level tournament, led 40 committee members, broadcasting team in MPLSG Season 9

Languages

- Professional: English
- Conversational: Chinese, Malay

Participations

San Diego CTF, Rentas CTF, SD CTF 2024, and L3akCTF 2024, Great Malaysia AI Hackathon by AWS

Technical Skills

Language	Python · Javascript · TypeScript · Bash
AWS	Lambda · CloudWatch · EC2 · S3 · VPC · EKS
CI/CD	GitHub Actions · GitLab CI/CD
Tools	Docker · Kubernetes · Terraform
Databases	MySQL · PostgreSQL

Projects

Schedulr - Timetable management system ([Website](#))

- Open-source cross-browser extension for MMU students and lecturers to automate the process of transferring timetables from university portal to digital calendars
- Eliminates manual data entry, turning time-consuming hour-long task into a few-second process. Has fixes for common data inconsistency in the university portal
- Setup proper environment (dev/stg/prd) and github action to streamline development process, monitor project with sentry and report issues to slack channel with webhook
- Tech: JavaScript, HTML, CSS, Google Calendar API, OAuth 2.0, Cloudflare Workers, Supabase, Rollup, GitHub Actions
- Skills: GCP Deployment, CI/CD, Secrets Management, REST API, Environment Management, Monitoring/Alerting

Automated DevSecOps Pipeline

- Engineered a hardened CI/CD pipeline using GitHub Actions to enforce automated security gates, ensuring secured container images reach the staging environment
- Developed an automated remediation service that identifies dependency vulnerabilities and programmatically generates MR to reduce manual security toil and MTTR
- Implemented infrastructure-as-code (IaC) scanning to detect security misconfigurations in templates before provisioning, establishing proactive security posture
- Tech: GH Actions, Python, Docker, Trivy, Gitleaks, Terraform
- Skills: DevSecOps, Shift-Left Security, CI/CD Automation, Vulnerability Management, Python Development

Cloud-Native Security Governance & Observability

- Deployed a secure, scalable K8s cluster utilizing admission controllers to enforce Policy-as-Code/programmatically block non-compliant workload configurations
- Architected a centralized security observability layer by streaming audit logs into ELK/Prometheus stack, enabling real-time detection of API anomalies and forensic analysis
- Integrated HashiCorp Vault for dynamic secrets management, eliminating hardcoded credentials and streamlining secure access control across microservices
- Tech: AWS EKS, Kubernetes, Kyverno, HashiCorp Vault, Prometheus, Grafana, ELK Stack
- Skills: Cloud Security, Policy-as-Code, Observability, Secrets Management, Zero-Trust Architecture

Homelab

- Orchestrated a containerized environment on Debian using Docker Compose to enforce IaC principles, ensuring repeatable deployment and management of services.
- Deployed a secure, encrypted remote-access layer via Tailscale SSH and a unified observability stack for real-time monitoring of system and container health.
- Tech: Docker (Compose), Tailscale, Prometheus, Grafana, cAdvisor, Node Exporter.
- Key: SysAdmin, Network Security, Observability & Monitoring, IaC, Linux.

Referee

Roy Chiu, Security Automation and Detection Team Manager @ Grab manshan.chiu@grabtaxi.com
